

AMAZON SALES ANALYSIS REPORT

Business Intelligence Dashboard Project

This report presents a comprehensive Amazon Sales Analysis project developed using Power BI, Excel, and Business Intelligence techniques. The project focuses on analyzing sales performance, profitability trends, customer purchasing behaviour, and product category performance through interactive dashboards and data visualizations.

Project Title	Amazon Sales Analysis Dashboard
Tools Used	Power BI, Excel, DAX
Domain	Sales & Business Intelligence Analytics
Dataset Records	3203
Dashboard Type	Interactive BI Dashboard

Project Overview

The Amazon Sales Analysis project was designed to transform raw sales datasets into meaningful business insights using Power BI dashboards and business intelligence reporting techniques. Key project activities included:

- Data cleaning and preprocessing
- Exploratory Data Analysis (EDA)
- Sales and profit analysis
- Customer behaviour analysis
- Product category performance analysis
- KPI creation and reporting
- Interactive dashboard development

Key Business Metrics

Metric	Value
Total Sales	\$725,457.82
Total Profit	\$108,418.45
Total Orders	1611
Top Performing Category	Chairs

Dashboard Features

- Interactive filters and slicers
- KPI cards for sales and profitability metrics
- Category-wise and region-wise analysis
- Sales trend visualizations
- Customer purchasing behaviour insights
- Operational performance reporting
- Dynamic business intelligence dashboard

Detailed Business Analysis

1. Sales Performance Analysis

Analyzed total sales across categories and products to identify high-performing business segments and revenue-driving products.

2. Profitability Analysis

Evaluated profit trends and profitability metrics to understand business performance and operational insights.

3. Customer Behaviour Analysis

Studied customer purchasing patterns and buying trends using interactive dashboard visualizations.

4. Product Category Analysis

Compared category-wise sales contributions to understand product demand and customer preferences.

5. Operational Insights

Analyzed order statuses and operational reporting to identify performance trends and workflow efficiency.

Skills & Technologies Applied

- Power BI Dashboard Development
- Data Cleaning & Transformation
- DAX Measures and KPI Calculations
- Data Visualization & Storytelling
- Business Intelligence Reporting
- Sales & Profit Analytics
- Interactive Dashboard Design
- Analytical Thinking and Insight Generation

Learning Outcomes

This project strengthened practical understanding of business intelligence workflows and dashboard development techniques. Key learning outcomes include:

- Building professional Power BI dashboards
- Understanding sales and financial analytics
- Performing customer behaviour analysis
- Developing KPI-driven reports
- Enhancing dashboard storytelling skills

Conclusion

The Amazon Sales Analysis Dashboard project successfully demonstrated the use of Power BI and Excel for business intelligence reporting and sales analytics. The dashboard transformed raw business datasets into meaningful insights through interactive reporting and visualization techniques, reflecting strong analytical and dashboard development capabilities.

Prepared as part of the Amazon Sales Analysis Business Intelligence Project.
